

Scenario-Based DAX Interview Questions (Experienced Power BI Developers)

1. Filter Context & CALCULATE

Scenario 1: You have a Sales table with Date, Product, Region, SalesAmount. Show Total Sales ignoring Region filter but respecting Date & Product.

Scenario 2: Show Sales for only South region, even when user selects other regions in slicer.

2. Time Intelligence (Advanced)

Scenario 3: Calculate YoY Sales Growth %, handle missing previous year data safely.

Scenario 4: Running total of Sales without using Date column.

Scenario 5: Show Last 3 Months Sales dynamically based on selected date.

3. Ranking & Top-N

Scenario 6: Create dynamic Top-N Products using a slicer.

Scenario 7: Show Top 5 products per region.

Scenario 8: Display Top-N with “Others” category.

4. No Relationship Scenarios

Scenario 9: Sales and Target are in two tables with no relationship. Show Sales vs Target in one visual.

Scenario 10: Compare Budget from disconnected table with actual sales.

5. Row Context vs Filter Context

Scenario 11: Explain why SUM(Sales[Amount]) works differently in calculated column vs measure.

Scenario 12: Convert row context into filter context.

6. Conditional Logic

Scenario 13: Classify customers as High / Medium / Low based on sales.

Scenario 14: Show “Out of Stock” instead of blank quantities.

7. Virtual Tables (Advanced)

Scenario 15: Calculate Average Sales per Product using virtual tables.

Scenario 16: Calculate % Contribution of each product to total sales.

8. Many-to-Many & Ambiguity

Scenario 17: You have ambiguous relationships. How do you solve it without bidirectional filtering?

9. Performance Optimization

Scenario 18: Calculated Column vs Measure – when to use what?

Scenario 19: Why is `FILTER(Sales, Sales[Amount]>1000)` slower than using `CALCULATE?`

10. Real Business Scenarios

Scenario 20: Show Sales Growth only if current year sales > previous year, else blank.

Scenario 21: Calculate % Achievement, cap at 100%.

Scenario 22: Dynamic KPI showing Green if Growth > 10%, Yellow if 0–10%, Red if negative.

11. Advanced Context Handling

Scenario 23: Why does total not match sum of rows? How do you fix it?

Scenario 24: Calculate distinct customers per month, respecting slicers.

12. Slicer & Dynamic Logic

Scenario 25: Use slicer to switch between Sales / Quantity / Profit.

Scenario 26: Default slicer selection logic using DAX.

13. Interview Trap Questions

Scenario 27: Why LOOKUPVALUE fails in measures sometimes?

Scenario 28: Difference between ALL, ALLSELECTED, REMOVEFILTERS.

Scenario 29: Why does RANKX give unexpected ranks?

Scenario 30: Explain how Power BI evaluates a DAX measure step-by-step.
